

Plant Dip

To disinfect and kill snails and algae

We **HIGHLY** Recommended that you treat / disinfect all new plants before introducing them to your pond using Potassium Permanganate.

Potassium Permanganate Dip

To prepare a disinfectant dip, use a bucket filled about 1/2 full of water. Add enough Potassium Permanganate to color the water a dark pink (It does not take very much at all! This solution can be saved for later use. To disinfect and kill most algae a 10-20 minute dip (more like bath) in Potassium Permanganate is very effective. Rinse the plants under tap water thoroughly to neutralize the Potassium Permanganate.

CAUTION: Potassium Permanganate is a strong oxidizer. Like all chemicals you should wear protective eye wear and gloves. Potassium Permanganate will stain clothing, carpeting, skin, etc. Never combine Potassium Permanganate and Formalin; this will result in explosive results and dangerous gases.

I carry Potassium Permanganate, and have stock solution on hand that you may use to safely measure and add to your bucket.
